Welcome to Foundations in Biology I!

What is this course?
This course is titled ‘Foundations’ on purpose, because we want to help you build a strong foundation for future learning. It is intensive because building a good foundation takes hard work. You will learn more than you thought possible and emerge with usable knowledge, well-developed scientific skills, improved writing and arguing skills, and a more in-depth approach to learning science.

Who is the course for?
While this course is required for some students, it is meant for anyone with an interest in exploring how life works. We assume you have basic high school biology and chemistry knowledge to build on. We provide ample help for anyone struggling… and we all struggle at times.

We are a community. Science is a team sport, and this course is too!

Contact Information: Professors: Dr. Jeanetta Floyd  jf1605@georgetown.edu, Regents 375 and Shauna Bennett sb1949@georgetown.edu

Lectures/Recitation: MTWR 8:30 am - 10:25 am, Regents 239

Laboratory:* MTWR 10:50 am - 12:45 pm, Regents 353

Office Hours: M, Tu, W, Th by appointment.

*Although there is separate registration for Biol-105 and Biol-115, we highly suggest you take both. We view the lecture and lab as one integrated whole (as it is during the typical semester)

Materials
For Lecture: Textbook is Biology: How Life Works, 1st, 2rd or 3rd edition, by Morris, Hartl, Knoll, Lue.
We recommend buying it with the “LaunchPad Portal” (ISBN#: 978-1464126093) to get access to e-text (it’s in the bookstore, but cheaper through Amazon). Older editions of the book are also OK if necessary. Some of the chapters are rearranged, but the information should be the same.

We don’t use the book for assignments, but you will need it for reference and to provide some different context to the lecture material. We will cover topics in class that are not covered explicitly in the texts, and you will read about different examples that we will not discuss in detail. So, to do well, attend lectures and do readings.

For Lab: You will be provided with a lab manual.
Foundations in Biology I (BIOL-105/115) Summer 2023

Course Expectations

I expect you to: be engaged, come to each class prepared, treat all members of the class with respect, and turn assignments in on time. (You can expect the same from me!)

Lectures
The schedule of lecture topics is listed in the calendar below. Review textbook content before class so you’re ready to discuss. You should be able to spend class time in active learning and productive discussions.

Attendance is important and expected. Active engagement is also expected. We will work in small groups each day to discuss the day’s content and work on questions. The questions will follow the same format as in the exams.

Quizzes
We will have short quizzes as assignments each evening to review your understanding of the material and to help you think of the topics in the way that will be discussed during recitations and tested during the exam.

You CAN work together on the quiz – and it’s good for you to do so. You can use your notes, the textbook, or lecture slides. Can you use the internet? No. Answers through Google are likely to confuse you at our level of learning. Quizzes will taken on Canvas and will be available from the end of the prior class until midnight. Late quizzes will not be accepted.

Laboratory
Each lab has been designed to teach and achieve the following two goals:

i. To think and write critically in a Biology context and on Biology content.
ii. To learn to work together with other students, as being able to work with others, and to form a cohesive community, is key for success in biology, medicine and STEM related fields.

If you are enrolled in Biol 115 laboratory, your attendance and active involvement in all labs is required. It is not possible to make up a missed lab during Summer. You will receive more detailed information about the expectations during lab time. Please note: 2 or more unexcused absences from lab will result in failing the entire course.

Read through your lab manual before class. You will have pre-lab and post-lab assignments. No late pre-labs are accepted. Late post-lab assignments will result in loss of points (details below).

Getting your Questions Answered.
There are many people that can help you get your questions answered. During class time, laboratory time, after class, or by appointment or email. ALL questions are valid. Don’t let yourself fall behind—just ask!

Late Policy – assignments and exams
Assignments are due on their due dates. All due dates will be available on the Course Schedule and
Foundations in Biology I (BIOL-105/115) Summer 2023

on Canvas. Late Post-Lab and Research Paper assignments will lose 10% per day; nothing will be accepted after 2 days. Note that the last Postlab cannot be late. Doing things on time is extremely important for your learning in this accelerated summer course, but it’s also imperative so we can provide you feedback in a timely way.

There will be no unexcused make-up exams or quizzes, regardless of circumstances. To be excused from an exam due to a documented family emergency or illness, you must notify me before the exam and provide appropriate documentation. A replacement assignment might be assigned in these circumstances and will be expected to be completed by the deadline.

Unexpected circumstances sometimes come up. Talk to me early if there is a possibility you will miss something. Don’t wait until it’s after-the-fact, or too late. Let’s work together to finish the course.

If you miss an exam for any other reason or fail to notify me in advance, you will receive a zero.

### Grading

The grade for each course is determined by the following algorithm:

#### Biol-105 lecture (3 credits)
- 100 points – Exam #1
- 100 points – Exam #2
- 100 points – Exam #3
- 200 points – Final Exam (Cumulative)
- 100 points – Research Paper
- 110 points – 16 Quizzes (worth 7+ points each)
- 40 points – Participation (-5 pts per unexcused absence)

750 points – COURSE TOTAL

#### Biol-115 lab (2 credits)
- 200 Points – 4 Post-Lab papers
- 40 Points – Pre-Labs
- 10 Points – Participation
- 250 points – COURSE TOTAL

There are no opportunities for extra credit work in the very short intensive course. Please focus on the assignments and exams given here.

The following guideline is used to calculate end-of-semester grades. If you take both courses, I will take the time to consider at the end of the semester if your grades will be for the entire course, or separate for the two courses, depending on which works to your advantage.

- $A \geq 93.0\%$
- $90.0\% \leq A- < 93.0\%$
- $87.0\% \leq B+ < 90.0\%$
- $83.0\% \leq B < 87.0\%$
- $80.0\% \leq B- < 83.0\%$
- $77.0\% \leq C+ < 80.0\%$
- $73.0\% \leq C < 77.0\%$
- $70.0\% \leq C- < 73.0\%$
- $67.0\% \leq D+ < 70.0\%$
- $65.0\% \leq D < 67.0\%$
- $F \leq 65.0$
Learning Goals

The Department of Biology has set scientific content, process, and communication learning goals for the 4-year curriculum (biology.georgetown.edu). The two semesters of Foundations of Biology share responsibility for introducing each of the ten learning goals as a means to build your biological ‘foundation’. Thus, this course is not just about building your scientific knowledge. Much more importantly, it is about deepening your understanding of the epistemology of science and your ability to effectively communicate your scientific ideas. Ultimately we’d like you to think about yourself as a scientist, not just a student of science.

Georgetown Biology Department Learning Goals (and how material from this course relates)

Insight into the Process and Product of Science
We begin our learning goals with a focus on process to emphasize our belief that the goal of a biology education is to enable students to make creative and careful use of their knowledge. Only then will they be scientists.

1. Integrate New Knowledge into Existing Intellectual Frameworks
   Material for this course is foundational through the semester, and to a degree in the Biological Sciences. In addition, you will be expected to write a literature review.

2. Engage with Scientific Inquiry
   The labs and literature review will help you engage in and understand research science. Most labs will be inquiry-based learning labs.

3. Represent and Interpret Data in Quantitative and Statistically Meaningful Forms
   Lab 3, 4 and 5 will engage specifically in using and understanding quantitative data.

4. Communicate Scientific Understanding in Oral and Written Forms
   Through lab reports, you will have a chance to engage in scientific writing.

5. Appreciate the Epistemology of Science
   Throughout the course, we will focus on the systems of knowledge that makes up Science, and understand how this system differs from other knowledge systems.

Fundamental Biological Concepts
Two themes relate to the five categories of fundamental biological concepts that we describe below and we list them here:

- Our understanding of chemistry, mathematics, and physics enables us to understand biological phenomena. It is therefore essential that Biology students have a strong foundational understanding of these fields – of both their concepts and their “ways of knowing”.

- Evolutionary mechanisms create and profoundly affect organisms and their characteristics. It is therefore essential that Biology students have a strong foundational understanding of the theories, evidence, and mechanism of evolution.

6. Organization of Molecular, Cellular, Organismal and Ecological Systems
   The first quarter of the course focuses on molecules and a biochemical approach to understanding biology, while the second quarter focuses on cells.

7. Evolution as a framework for understanding biological systems
   This core theory is implicit in all discussions and labs.

8. The Flow of Biological Information
   The third quarter of the course will focus on the central dogma and understanding material related to molecular biology.

   Metabolic pathways are a key portion of the second quarter.

10. Interdependence and Interactions within Biological Systems and Their Emergent Properties
    For the last quarter of the course, we will focus on integrated physiology.

The Ethos of Foundations in Biology: Basics + Inquiry + Ownership = BIO

“Basics” – Biology courses tend to be about what we already know – and at their best, how we came to know it. This is what I call the “basics” – and it is an important part of the whole. But it is only one part, yet Biology courses and textbooks tend to make it the “end all and be all”. So, let’s say that a mastery of the “Basics” is (only) one goal of this course.

But biology itself is largely about what we don’t yet know! Biology courses should therefore embrace this and teach to this as a goal as well. But how? We’ll foreground two additional elements in this course. Two points that can in part be summarized by the phrase “The Value of Not Knowing”:

“Inquiry” – meaning asking questions and searching for answers, investigating, and working at the edge. Authentic inquiry is really quite fraught and of necessity means a high failure rate. The NY Times, writing about Dr. Eric Wieschaus, 1995 Nobel prize winner in developmental biology, said “Dr. Wieschaus said he was amazed at having conducted experiments that actually worked. ‘Ninety percent of the time they didn't work,’ Dr. Wieschaus said, a situation that he said was much the same in his current work.”

“Ownership” – engagement and self-awareness, making it yours and being responsible for making it yours, knowing what you know and what you don’t know. To truly learn something, you must have the ability to know what you know – and to know what you don’t know. (Re-read that a few times until it makes sense!) Indeed, it is the latter ability that makes you an expert learner because only by defining the gaps and misconceptions in your knowledge can you work effectively to repair them.
Unfortunately, students expend a lot of energy trying desperately to hide what they don’t know: in class, on tests, and even in conversations with peers. How often have you refrained from asking or answering a question in class because you thought you would look dumb? How often have you simply written aimlessly on an exam, hoping that somewhere in the torrent of words, there might be a word or two that would gain you some partial credit? Sigh… These actions are of course just the opposite of what would really help you learn, but they are very ingrained into our nature, and they are often rewarded by teachers who look happy that the class has no questions – or by the stray point or two you pick up on short answer questions when you really didn’t know the answer.

We want to change that in this class. We want this class to be a place where you feel supported – and rewarded (note this emphasis) – for exploring the realm of what you don’t know and for having the courage to make mistakes. We will truthfully acknowledge that this is probably an easier sentiment to express than it is for me to enable and you to perform. It is easy to support students in learning information, relatively easy for students to learn information, and easy to check to see if students know it. It is harder to support students in learning habits of the mind, equally hard for students to learn how to learn and how to become scientific thinkers, and very hard to assess this process… and in particular to reward failure.

But if we want to have this course mirror authentic scientific practice than we must do that very thing. How can we together transcend the usual practice of staying only in charted waters? We’ll need to change a few significant aspects of the course that will likely make it quite different from previous science courses you have taken. Be forewarned… and read on!

Changing Class Habits: The classes will be interactive. It will be a time of active learning, so come prepared to work together in groups to discuss ideas, problem solve, brainstorm, etc. This will be true in lecture and especially in the smaller recitations.

Changing Lab Habits: The labs are very open-ended and inquiry-driven. There will be lots of cutting edge science, lots of opportunity to talk about the science that you are doing, lots of opportunities to design your own experiments, and lots of opportunities to have experiments fail! This will be cool – we promise – but likely very different and a bit unnerving if you have never had this level of freedom and responsibility in a lab before.

Changing Reading Habits: We will work to make the readings an interactive experience by providing Blackboard Discussion Boards as a means to allow you to talk with your colleagues about the information and ideas as you are reading about it. Recitations will also be a good time for talking about your own ideas and questions.

Changing Writing Habits: Writings this semester – for lab and for the research paper – will focus on developing the skills of thoughtful scientific analytical thinking. Get used to thinking hard before you put fingers to keyboard. You will be judged on the strength of your arguments rather than on the conclusions you draw.

Changing Exam Habits: The exams will provide an opportunity – and reward points accordingly – for insightful answers that cogently address both what you are certain about and what you are uncertain about.

“In the real science you aren’t too worried about the right answer… Real science recognizes that you have an advantage over practically any other human enterprise because what you are after – call it truth or understanding – waits patiently for you while you screw up. … Nature speaks in many tongues and we are all alien. What a scientist is trying to do is decipher one of those dialects. [If a scientist makes progress, we do so] because nature doesn’t change and we just keep trying. It’s not because we are particularly smart but because we are stubborn.” ~ Dudley Herschbach, Harvard chemist
How to Succeed in Foundations of Biology

Based on previous experience, we know that this course will be different than many of your previous biology classes. Hence, you may need to take a different approach to your studying. Here is a good list of successful strategies for approaching this course. Not all of them will be right for you – but some of these will help!

Time

How much time should this course take each week? We get asked this a lot, and while it is hard to give a good answer, here are some general guidelines: 2 hours in class + 2.75 hours in lab + 2 hours reading/discussion board + 2.25 hours other work (lab report/research paper/studying) = 4.75 hours in class and 4 hours outside of class = 10 hours total per day. This short intensive class is a full-time job and you should treat it as such. Plan to spend an additional 10 hours on the three days you are not in the class to revise, review and prepare for exams. Sit down with your planner now and set aside blocks of time. Remember that this is a 5-credit course.

Individual v. Group Effort

You’ll need to find a balance that works for you between working solo and working with a partner or two. It can often be helpful to have someone with whom you can sort through difficult concepts; this is why you work in pairs in the lab, and converse on our discussion board. But you also want to make sure that you take ample time to think through topics on your own so that you are clear about what you can understand and solve and create with just your own mind at your disposal. Most students find that it is best to think on their own first, figure out what they do and do not know; then use the group to fill in missing knowledge, and finally go back to working on their own to embed the new knowledge deeply.

Course Readings

There is a significant amount of reading in this course. You will be reading ~1-2 chapters a day, or ~40-80 pages. We remember being students in introductory biology course (many) years ago and being frustrated by our textbooks. We found them fascinating, but we also know that we often found it impenetrable and time-consuming. We compensated by either highlighting all of the information that was new to me (with the result of many soggy yellow pages!) or simply ignoring the book and hoping we wouldn’t really need it. Neither was an effective strategy. Let’s try to avoid that scenario for you by the following tips:

1. Be clear about why you are reading the textbook. You’re likely thinking this is a trick point: that the purpose is obviously to read the material in order to compress it into a set of more compact notes – i.e. that the purpose is to extract the facts. Nope! As lovely as it would be for you to be able to do this, it is pretty much an impossible task. Why? Have you seen the size of our textbook? Do you have any idea how much information is in that book? If you read it for the purpose of finding facts, get a shovel… there are thousands of them.

   So, then… why read the textbook? Glad you asked! The primary purpose of reading the book is to give you a first round of exposure to the topics before class – and a place to serve as a reference after class. We have a lot of ground to talk about in class and move quickly. We also use class as to problem-solve – trying out how well you understand the ideas. If you are encountering ideas for the first time in class, you simply won’t be able to keep up.

   So how do you know which ideas are the right ones to read and think about before class? Look at the powerpoint slides and see what parts of the chapter will be emphasized in lecture.
2. **Skim the chapter before class.** You can make more effective use of our time together if you come a bit prepared. This first reading should take you ~30 minutes per chapter. Aim for three goals when you read:
   - Familiarize yourself with the big concepts (what are the main 3 or 4 ideas?)
     - Each chapter starts with a set of Core Concepts. Read them first (or at least the ones that apply to the sections of the chapter you are assigned to read) and think about them until they make at least a bit of sense – i.e. slow down here and take time to think about what those brief sentences really mean.
     - Each chapter ends with a Core Concepts Summary. Read the relevant parts. These first two tasks are your key to identifying the big ideas in the chapter. They provide your roadmap to help you read with a purpose.
     - Make connections to your prior knowledge. Where do these new ideas fit what you already know? How do they surprise you because they don’t seem to fit?
   - Take very sparse notes. Just enough to put the roadmap down on paper (~1 side of a page). You’ll mostly use your class notes for studying, so the primary purpose of the book notes is really just to help you in your reading: many of us have brains that are wired to better understand something if we both read it and write it. Jot down a few big ideas, but mostly write out your questions: what don’t you understand?
   - Join the discussion board if you want to do so. Talking about an idea you are working to understand, asking a question about it, attempting to answer someone else’s question (even imperfectly or incompletely) is a great way to make your understanding stronger.

3. **Come to class.** Take great notes! We strongly advise that you print out the powerpoint slides and annotate these for your class notes. This way you won’t need to write down what we’ve already put on the slides for you.

4. **That same evening (!) go back to re-read the textbook.** Focus in on the parts that we talked about in class. Spend another hour with your textbook now.
   - Flesh out your class notes if you were incomplete in class.
   - Be sure that you are gaining a true understanding of the ideas (not just acquiring factoids) by trying to answer the orange questions and the end of the chapter questions.
   - Make sure you understand the hierarchy of ideas! Use trees to shape your notes.

5. **What about LaunchPad?** The online support that comes with the text has pros and cons. It’s a decent source of fact-based questions to test your knowledge. But it doesn’t really test your understanding, and that’s what is ultimately important in this course. And it tests all of the facts from the chapters, whereas we’ll be more selective. So, use it carefully.

**Conversations**
As you read, you’ll find that you have lots of questions and some new ideas. Talking about these is the best way to help you reinforce your understanding and clear up points of confusion. We’ll provide ample time in lecture, lab and recitation for questions and conversation, but we also want to provide a forum where you can have real-time conversations as you are reading the material.

**Lectures**
It is all too easy in a large lecture to sit there passively and let the ideas wash over you. But then lecture is largely wasted time from a learning perspective when it should really be among the most valuable time because we have so many minds in one room thinking about the ideas.
   - Look over powerpoints, and have them available as you listen to lectures. They are always up on Canvas before class.
Foundations in Biology I (BIOL-105/115) Summer 2023

- We strongly recommend that you write – not type – your notes; studies have shown the former to be much more effective as a tool for learning the material! Take quality notes on the Powerpoints and/or in a notebook – annotate the figures, use multiple colors, jot down questions/confusions, etc.
- Work hard to solve the problems that are sprinkled throughout the class. These problems will be a good way to test your understanding (and they often appear on exams!). If you don’t get a problem – or understand the answer – ask a question during recitation!

The volume of information in this course can be daunting. And importantly you will be expected to not only know the material but also be able to use the knowledge. This will require that you spend time reading, thinking, and doing with the ideas of the course on a continual basis and not just in a mad studying frenzy before each exam. More importantly, this will require you to practice using that knowledge. So, each lecture, we will have time set aside to work together, first by answering any questions you might have on the worksheets, then to give you time to work in small groups and practice answering the same types of questions you might expect in an exam for this course. It is of course therefore crucial that you come to class, and that you come to class prepared.

**Quizzes**
As an entry ticket to class, and to give you incentive and to reward your efforts of keeping up, you’ll have quizzes on which you can practice developing your scientific skills. (Hopefully you are by now getting the message that biology is NOT about memorizing facts – it is about thoughtfully tackling new ideas!)

These quizzes should be taken after lecture, but before coming to the next day’s class (for dates on when we will discuss a topic/chapter please see schedule above) Take the time to do these thoughtfully! Be sure that you can write a solid explanation for each of your answers; this is great practice for the exam. Seek help if you are truly stuck.

The last question of each quiz is an open-ended ungraded communication tool, where you can tell me if there is any aspect of the class that still confuses you. Note that this section should not be in lieu of you speaking with me or the TAs to get help.

**Research Paper**
You will be expected to write a research paper in this class. We will discuss the assignment in class to get you started. This paper will be based on scientific research and news articles. We will spend time in class and in lab showing you how to search for articles in the primary literature and how to read them. This assignment will be worked on throughout the semester.

**Lab**
There is a daily required lab. It follows the subject matter of the classes and will allow you to encounter science much more vividly than you can do via a textbook, to do and think about the process of science rigorously and creatively, to work collaboratively with your peers, and to write effectively about your research. Lab here is not about getting the right answer or ‘finishing’. A well-done experiment may provide insight (never answers) but usually just raises more questions. The entire concept of completion is really anathema to research.

Our goal is for you to slow down/observe, be rigorous/creative, think/do, write/reflect. Don’t stress about how far or fast you are going. But be sure to think carefully about everything you are doing as you move along. Your lab papers need to demonstrate the quality of your thinking and how well you understand what you did, why you did it, and what you learned from it (about the science and your scientific process). Write your lab papers to be understood by a peer.

One important trick is to think of the lab as a review session. We have designed the labs to illuminate many,
many of the big ideas in lecture. So, as you work in lab, slow down and keep trying to relate what is happening in the test tube (or under the microscope or on the gel) to the underlying concepts.

You will be ably assisted by our trained cohort of TAs. Your TA will have primary responsibility for mentoring you and evaluating your work, but I provide strong oversight. Any questions/concerns about the lab should be brought to their attention.

Writing
Both your Lab Papers and your Research Paper are opportunities for you to work on your (scientific) writing skills. Your grade will be largely dependent on how well you communicate your ideas – and that is in turn largely dependent on the quality of your writing. Quality of writing refers to the mechanics, the rhetoric, and the process. Details about writing goals are in the “Writing Goals” pages at the back of this document. If you struggle writing, we recommend you visit the Writing Center. (http://writingcenter.georgetown.edu/).

General points to keep in mind when writing:

- **Have something to say.** Be selective in what you choose to say. Put your main message(s) up front in your writing – in the form of thesis statements and topic sentences.
- **Remember your audience.** Your writings should be aimed at a peer who is unfamiliar with the specifics of your topic. Write to teach them.
- **Organize your arguments.** The goal of your writing is to support your message. You can discern your organization best post-writing by creating a quick and dirty outline from your writing: does that outline seem logical?
- **Revise your writing.** None of us has ever written something well the first pass through. Proofread with the goal of eliminating 20% of what you wrote the first time and restructuring the rest! Tighter writing is always better writing. And please double-check grammar, punctuation and spelling. If you are sloppy with these, you are likely sloppy with your science, too.

All work done in connection with this class must adhere to the rules of the Georgetown honor system. As responsible scholars, you are expected to properly reference at all times. Proper citations include a notation within the text and a reference list at the end of the text.

Your job as a responsible scholar is to critically evaluate your sources to be sure you are using only the highest quality information in your writing. This is particularly challenging with the vast proliferation of on-line material (see below for specific help with this topic) but is true of all sources. Just because it is published, doesn’t make it true.

Some tips:

- **Read with a critical eye** – Can you find the same information elsewhere by a different author? Do you see gaps in the logic? Is the information fully cited or are the data presented in the source? Does the author have a bias?
- **Read with a creative eye** – What can you do with the new ideas that you have just read? Does it lead you to new research? Does it lead you to re-evaluate your research question?
- **Be certain** that you have dug down to the origin of the information and are citing it properly – You should not be citing from a source if it is in turn only citing that information from another source. Be sure to find the original source for the information, read that and then cite it. Information can get blurred when it is handed down too often (like playing telephone as a kid). This is especially true with information on the web.
Be cautious with on-line sources – It is a remarkable how much information is now readily available at a click of the computer button. It is also dangerous how much false information is readily available at a click of the computer button. Check out this link for a really good resource on evaluating on-line sources: http://www.lib.berkeley.edu/TeachingLib/Guides/Internet/Evaluate.html

A note on Wikipedia. Everyone loves Wikipedia. I love Wikipedia. I use Wikipedia. BUT Wikipedia is not a peer-reviewed or professionally or impartially edited source. It has errors (like everything) but it also has bias from its authors. Use it with care and only as a starting point for further research! It cannot be your final citation for information!

Within the text citations:
Scientists do not typically use quotations within papers. They rethink and rewrite the information in their own words. You should do the same. Regardless of whether you use another person’s words or just their thoughts, you need to cite them. Please do not use footnotes!

Within-text citations should be as follows:
Journal article:
  Single author  (author last name, year)
  2 authors  (author last name and author last name, year)
  3 or more authors  (author last name, et al., year)
Book: As above, but include page numbers.

For example:  Others have recently shown that numerous enzymes are active at low temperatures; importantly, this is particularly true of enzymes found in psychrophiles (Smith, et al., 2010).

End of text references:
These should be listed by author, in alphabetical order, exactly as shown below. If you cite from our textbook you must reference, too. Examples of proper references are given below. Follow the capitalization and punctuation precisely! Italicize all Latin names!

• For on-line sources, give the title of web site, author or editor, organization responsible for the site, date of site’s publication or date of last update, date of access, and the url. A regular scientific journal article accessed on-line is an article, not an on-line source!

Exams
Exams will be conducted on the dates listed above. Exams will be closed book.

We will be relying on your honor. I have compelling evidence that a student did not keep to the honor code, I will have no choice but to bring a case against that student to the honor council.

All exams will be cumulative. This means that while the questions on each exam will focus on the most recent material, you will be expected to be able to integrate ideas throughout the semester. Each exam question will be written so that you can describe what you know and what you don’t know about the answer. You will gain credit for accurate accounts of both, though you can only achieve full credit by actually knowing the answer.
Studying

The exams are designed to take 60 minutes I will give you 2 hours. If you require extra time on exams or special testing conditions, please be sure to see the Academic Resource Center (3rd floor Leavey Center) to complete the required paperwork.

If you cannot take an exam on the designated day, you must get permission in advance from the professor to take a make-up exam.

Exams will be returned soon after you have taken it. If you disagree with the grading of a question, you must submit a written request for a re-grade.

- Your request must clearly explain why your answer merits more credit than it received.
- Re-grade requests must be submitted in lecture by the day after your exam was returned.
- You should know that a re-grade request opens the question to a fresh assessment. The result may be an increase or a decrease in the grade.

The FINAL EXAM is scheduled for Fr Aug 12th. You must be in attendance to take the exam.

Studying for Exams

1. **Look ahead.** Exams from previous years are available on Canvas. At the very beginning of a new unit, look at these exams. This will help make the finish line clear.

2. **Repeated exposure** to the material – even if brief – is better than trying to study all at once before the exam. This is especially important on exams that ask you to apply your knowledge. So, try this as a weekly pattern:
   a. Briefly read the text the night before class and jump into the Bb conversation.
   b. Attend class and be an active participant.
   c. Look over the notes/slides/textbook that evening. Fill in gaps in your notes. Be sure you are clear on the big ideas. Write down questions you need to get answered.
   d. Complete the problem set that week. This will give you an opportunity to really try to use the ideas when solving new problems.
   e. Review the day’s material the previous night. One very useful technique is to organize the information from the week into a tree or flowchart of ideas; this will help you organize the information and to be clear on what are big, medium, and small ideas in each topic.
   f. Apply your knowledge in lab. We’ve worked hard to align class and lab. Use this to your advantage and think in lab! Try to apply new ideas, vocabulary, etc.

3. **Practice problem solving.** The exams are all about applying your knowledge. So… when you study, be sure to continually test the depth of your understanding. How? Rework the questions in the text, the questions at the end of the chapter, the questions we did in class, the questions from the quizzes and recitation. And you can make up new questions by just extrapolating a bit beyond the questions you already have in hand; tweak the scenario and see if you can figure out the consequence: what would happen to a cell without telomerase? without a peroxisome? Why would a cell need twice as many mitochondria? What if DNA polymerase was less accurate? What if…?

4. **Practice writing out your explanations.** Thinking about ideas to yourself and expressing them concisely in written form are different skills, and you need to practice the latter to do well. Note that we do NOT use the term “answer” here. Ironically, one of the worst things you can do when you see a new question is to immediately say “Aha! I’ve got an answer!” This is because a good “answer” is really all about the explanation. We often don’t give much or any credit for just the answer alone! What earns you credit is the explanation.

5. **Use bullet points to build these explanations.** Use bullet points as a quick way to organize your explanation into a set of coherent and connected ideas. Think of each bullet point as one part of the
full explanation. If you add the bullet points up, they should equal the answer!
6. **Emphasize class notes when studying.** It is simply impossible for you to learn all of the information in the textbook. Reading through it is important to give you a brief exposure to the full breadth of information, and reviewing it can help clarify concepts form class. But what you will be held responsible for on exams is what we talk about in class. So when you study, don’t go back to re-read the chapters. Focus on understanding the material we talked about in class (the book can help you do this) and applying that material.
7. **Make sure you know the theory behind your lab work.** Lab exists in part to reinforce the theory behind the scientific principles we discuss in class. Do include it in your studying.
8. **Study in small groups** but be sure to let everyone in the group try to answer a problem independently before you share ideas. This is the way to gauge your own understanding.
9. **Get extra help.** I am available! Ask for extra help, please!

**Test-Taking**
1. **Get sleep the night before and eat something for breakfast.** Your brain works better when it is well-rested and well-fed. Really.
2. **Pace yourself!** Stick to the time recommendations so that you don’t overwrite for the first problems and run out of time at the end! Don’t get too hung up on problems that confuse you and don’t focus too much on the problems with which you are comfortable.
3. Students struggle to provide the right level of detail in their answers. So pretend that your audience on the exam is an imaginary peer who missed that day of class. They know a bunch of biology, but they need the steps of the answers spelled out for them, and don’t clutter their thinking with extraneous ideas!
4. Use the same bullet point idea as you did when studying. Try this idea:
   a. **Read the question** carefully (including the title) and underline important terms.
   b. **Stop and brainstorm** for 30 seconds. What ideas come to mind that you think you want to include in your answer?
   c. **Write these down as bullet points** with some space in between. Then write a sentence or two next to each bullet point. You don’t even need complete sentences – just complete thoughts! Quick pictures are good, too.
   d. **THEN – and only then – think of your answer by connecting the dots.**
   e. **Move on** to the next question and the next and the next…
   f. **Go back** with the extra time to reread your answers and flesh them out as needed.
5. If you don’t know an answer – or can only get partway to an answer – don’t panic. Put down the bullet points of what you do know, and then with your last bullet point try to be as specific as possible about what you don’t know that is preventing you from answering fully.
6. Pssst: email Prof Bennett before the first exam with the subject "I Read the syllabus!" and you will receive 5 BONUS points towards your final total.

**Policies**

**Honor Code**
Georgetown’s honor code prohibits academic dishonesty – including cheating, plagiarism and false citations – and I must report any suspicion of plagiarism to the Honor Council. To quote the Honor Guide:

(1) “Cheating is the use or attempted use of unauthorized materials, information, study aids, or unauthorized collaboration on in-class examinations, take-home examinations, or other academic exercises.” Cheating is an honor code violation for both the giver and receiver of information. I will be quite specific when collaboration is encouraged/required; if it is ever unclear – ask! Do not make assumptions. On all assignments, provide the name of all students who have contributed intellectually to the assignment.
Foundations in Biology I (BIOL-105/115) Summer 2023

(2) “Plagiarism is the act of passing off as one’s own the ideas or writings of another.” and “False citation is the attribution of intellectual property to an incorrect or fabricated source with the intention to deceive.” Follow the rules described in the citations section.

To be clear about how we are vigilant about academic dishonesty:

(3) All written work may be submitted to Turnitin.com.

We have come across several instances of plagiarism in my time at Georgetown, and several points worth noting have emerged: (1) Plagiarism typically results from last minute pressures to complete an assignment. Work ahead of schedule! (2) Boundaries between collaborative and individual work can seem blurry. We will try to be clear, and you should be sure to ask when you are uncertain. (3) Plagiarism is remarkably easy to detect. Really. (4) All experiences with the Honor Council have been thoughtful and respectful – yet uncomfortable for all involved.

As Rick Pitino once said "When you have a problem, if you tell the truth, the problem becomes part of your past. If you lie, it becomes part of your future."

IF you find yourself “stuck” (e.g. desperate about a deadline and seeing no option but to take a “shortcut”), just relax. Keep working. Write to the professor and your TA to alert us that you will be turning in the assignment late. Then, we can work together to help you finish your assignment promptly and thoroughly. No grade is worth sacrificing your integrity.

To learn more about the Honor System: http://gervaseprograms.georgetown.edu/hc/honor_system.html
If you are unclear what constitutes plagiarism, please read:
http://gervaseprograms.georgetown.edu/hc/plagiarism.html

On all lab papers, research papers, and exams, you must sign the University Honor Pledge:
In the pursuit of the high ideals and rigorous standards of academic life,
I commit myself to respect and uphold the Georgetown University Honor System:
To be honest in any academic endeavor, and to conduct myself honorably, as a responsible member of the Georgetown community, as we live and work together.

Turnitin Statement: Students agree that by taking this course all required papers may be subject to submission for a Textual Similarity Review to Turnitin.com for the detection of plagiarism. All submitted papers will be added as source documents in the Turnitin.com reference database solely for the purpose of detecting plagiarism of such papers in the future. Use of the Turnitin.com service is subject to the terms of use agreement posted on the Turnitin.com site.

Title IX Syllabus Statement (endorsed by Faculty Senate)
Georgetown University and its faculty are committed to supporting survivors and those impacted by sexual misconduct, which includes sexual assault, sexual harassment, relationship violence, and stalking.
Georgetown requires faculty members, unless otherwise designated as confidential, to report all disclosures of sexual misconduct to the University Title IX Coordinator or a Deputy Title IX Coordinator. If you disclose an incident of sexual misconduct to a professor in or outside of the classroom (with the exception of disclosures in papers), that faculty member must report the incident to the Title IX Coordinator, or Deputy Title IX Coordinator. The coordinator will, in turn, reach out to the student to provide support, resources, and the option to meet. [Please note that the student is not required to meet with the Title IX coordinator.]. More information about reporting options and resources can be found on the Sexual Misconduct Website:
https://sexualassault.georgetown.edu/resourcecenter.
If you would prefer to speak to someone confidentially, Georgetown has a number of fully confidential professional resources that can provide support and assistance. These resources include:

Health Education Services for Sexual Assault Response and Prevention: confidential email sarp@georgetown.edu

Counseling and Psychiatric Services (CAPS): 202.687.6985 or after hours, call (833) 960-3006 to reach Fonemed, a telehealth service; individuals may ask for the on-call CAPS clinician

More information about reporting options and resources can be found on the Sexual Misconduct Website.

(Above statement and TIX faculty resources found at: https://sexualassault.georgetown.edu/get-help/guidance-for-faculty-and-staff-on-how-to-support-students/)

**Title IX Pregnancy Modifications and Adjustments**

Georgetown University is committed to creating an accessible and inclusive environment for pregnant students. At any point throughout their pregnancy, students may request adjustments/modifications based on general pregnancy needs or accommodations based on a pregnancy-related complication or medical need. Students may also request accommodations following labor and delivery based on a complication or medical need.

SCS students must complete the Pregnancy Adjustment Request Form (https://titleix.georgetown.edu/title-ix-pregnancy/student-pregnancy/) and submit it to the SCS Deputy Title IX Coordinator at titleixscs@georgetown.edu. Upon receiving the completed form, the Deputy Title IX Coordinator will schedule a meeting with the student to discuss the requested adjustments and implementation process.

More information about pregnancy modifications can be found on the Title IX at Georgetown University Website.
